The present sequence is that of human antitumour protein PRO207, deduced from a foetal kidney cDNA clone (see AAA49717). PRO207 shamino acids sequence identity to tumour necrosis factor family mem emperially human lymphotoxin-beta (23.4%) and human CD40 ligand (Mol.wt. is 27,216. A claimed method for inhibiting the growth of cell comprises exposing the tumor cell to PRO199, PRO207, PRO320, PRO221, PRO224, PRO328, PRO310, PRO526, PRO362, PRO365, PRO365, PRO369 or (see AAY95337-49), their agoniers or chimeric polypeptides incorp them. The tumour is especially a cancer selected from breast, ovarenl, colorectal, uterine, prostate, lung, bladder and central n system cancer, melanoma and leukaemia. Methods for the recombinan expression of the antitumour proteins are also provided
                                                                                                                                                                                                                                  Novel composition to inhibit neoplastic cell growth or for treati. in mammal comprises polypeptides PRO119, PRO207, PRO320, PRO219, PRO224, PRO328, PRO301, PRO526, PRO362, PRO356, PRO360 or PRO866.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 VAEEDQDPSELNPQTEESQDPAPFLNRLVRPRRSAPKGRKTRARAIAAHYEVHPR

```
The present invention relates to the isolation of novel human PR polypeptides and the polymucleotide sequences encoding them. The polypeptides, agonists, antagonists or anti-PRO antibodies are u treating benign or mailgnant tumours (e.g. renal, kidney, bladde breast, etc), leukaemias and lymphoid malignancies, other disord as neuronal, glial, astrocytal, hypothalamic, glandular, macroph stromal and blastocoalic disorders, inflammatory, immune and ang disorders. The polymucleotide sequences are also useful in gene AAUB66162 represent the human PRO polypeptides of the in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         61 VAEEDQDPSELNPQTEESQDPAPFLNRLVRPRRSAPKGRKTRARRAIAAHYEVHP

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             sequence represents a TWEAK protein. The specification method for preventing or treating an immune response in an animal. The method comprises of a TWEAK blocking agent. The method may be used for nd treating immune disorders associated with inappropriate nd/or activity of TWEAK. These disorders include autoimmune use and chronic inflammation, organ transplant rejection,—Host disease (SMID), lymphoid cell malignancies, septic and of shock, loss of immune responsiveness (as seen in human ency virus. (HIV) infections) and failure of the immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    EDQDPSELNPQTEESQDPAPFLNRLVRPRRSAPKGRKTRARRAIAAHYEVHPRPGQD 155

The invention relates to an isolated nucleic acid molecule encoditumour necrosis factor family ligand. A composition comprising thisolated antibody or its fragment is used for treating an individual of decreased level of endokine alpha activity. The endokine polypeptide present in a heterotrimeric complex is used for treat individual having a disorder associated with excessive bone resor osteoporosis, Paget's disease or arterial calcification. Tre individual having a disorder associated with insufficient bone recomprises administering an endokine alpha antagonist, which is the antibody that binds specifically to endokine alpha polypeptide. Tantibody that binds specifically to endokine alpha polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                         human, tumour necrosis factor, TNF ligand, endokine alpha, excessive bone resorption disorder; osteoporosis, Paget's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 / that binds specifically to endokine alpha polypeptide. The ates to compositions comprising heterotrimeric complexes of is factor (TMF) ligand family members, and their use in the evention and treatment of disease. In one embodiment, the complex comprises full-length or extracellular portions of l-length or extracellular portions of preferably vGGI or VVGI-SV. The heterotrimeric complexes in are useful for treating an autoimmune disease, cancer or and particularly for inhibiting cancer cell proliferation, or inducing apoptosis of I cells selection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0;

iogenesis in a mammal for treating diseases mediated by e.g. solid tumors and vascular deficiencies of cardiac or sue, by administering antagonist or agonist of TWEAK

Example 1; Page 41; 46pp; English.

The sequence represents a a fusion protein encoded by the express vector pDC409-LZ-TWEAK. The fusion protein comprises a growth hor leader, a leucine zipper multimerisation domain, and the extracel domain of human TWEAK. The fusion protein was used in the isolati human TWEAK receptor (TWEAKR)-expressing clones from a COS cell h cDNA library. The TWEAKR protein is a member of the tumour necrosi (TNF) family and induces angiogenesis. TWEAKR may therefore be us screen for and develop TWEAKR agonists and antagonists for the moof angiogenesis, to be used in the treatment and diagnosis of hum of angiogenesis, to be used in the treatment and diagnosis of hum characterised by ocular neovascularisation such as diabetic retin neovascular glaucoma, retinoblastoma, retinopathy of prematurity, retrofental fibroplasia, rubecats, uveitis, macular degeneration corneal graft neovascularisation, and inflammatory diseases such arthritis, rheumatism and psoriasis. Other treatable diseases incommitted that the continue continue continue and metastatic conditions such as sarcomas and carcinom. benign tumours and preneoplastic conditions, myocardial angiogenes haemophilic joints, scleroderma, vascular adhesions, atheroscleroplaque neovascularisation, telangiectasia, wound granulation, corratherosclerosis, peripheral atherosclerosis and ischaemia

Inducing angiogenesis in mammal at desired sites for promoting we healing, by administering soluble fragment of extracellular doma: tumor necrosis factor related endothelium proliferative agent  $p\kappa$ 

Example 2; Col 75-78; 53pp; English.

nvention relates to extracellular signal molecules, members of tumour necrosis factor (TWP) family molecules TREPA (TWT related endothelium proliferative agent). gically active TREPA are used to treat TREPA-associated ours or metastases. TREPA is used for inducing angiogenesis promoting wound healing and for vascularising grafted tissue 1 grafting and to promote tissue grafts. The present amino is human Uniting TREPA soluble construct. This sequence ologically active molecule is capable of inducing in HUVEC (human umbilical vein endothelial cells) cells

rosis Factor family receptor polypeptides and ligands -agnosis and treatment of prostate cancer and developmental abnormalities.

13A; 156pp; English.

or by describes isolated Tumor Necrosis Factor (TNF) family speptides: APO4, APO6, APO8 and APO9 or their active 1 isolated TYP related ligands 1 and 3 (TNRL1 and TNRL3) fragments. APO4 is useful for diagnosing prostate cancer

treated using levels of APO4 in an individual. Prostate cancer can treated using APO4 selective binding agents linked to a therapeut moietry. APO4 polypeptides are also useful for identifying selective binding agents, useful in diagnosis/treatment of disease by binding agents to the polypeptide/active fragment which is extracellular, expressed on the cell surface. The binding is preferably performed vivo. APO4 polypeptides/ active fragments are also useful for scrifor agonists and antagonists by binding and observing the changes activity. Effective pharmacological agents useful in diagnosis on treatment of disease are also identified using APO4 polypeptides/ fragments and APO4 signal transducer molecules that specifically with a cytoplasmic domain of APO4 and detecting a change in level activity. The method is performed in vivo or in vitro. APO polype activity. The method is performed in vivo or in vitro. APO polype are all useful for diagnosis/treatment of developmental or gestational useful for diagnosis/treatment of developmental or gestational and programmities. · · 77 VSLGSRASLSAQEPAQEELVAEEDQDPSELNPQTEESQDPAPFLNRLVRPRRSAPK 1 VSLGSRASLSAQEPAQEELVABEDQDPSELNPQTEESQDPAPFLNRLVRPRRSAPF 137 RARRAIAAHYEVHPRPGQDGAQAGVDGTVSGWEEARINSSSPLRYNRQIGEFIVTK RARRAIAAHYEVHPRPGQDGAQAGVDGTVSGWEEARINSSSPLRYYRQIGEFIVTF 197 YLYCQVHFDEGKAVYLKLDLLVDGVLALRCLEEFSATAASSLGPQLRLCQVSGLLA 37.7%; Score 107; DB 2; Length 208; 99.5%; Pred. ```
The sequence is that of mouse tumour necrosis factor related lic (TRELL). TRELL or active fragments can be included with a carrie pharmaceutical compositions to treat cancer, autoimmune diseases immune responses to tissue grafts, or to stimulate or suppress t system. It is useful to screen for TRELL receptors, by labelling detectable label and screening compositions for binding. Agents interfering with TRELL receptor binding can also be screened for then be administered, optionally with interferon-gamma, to induct then be administered, optionally with interferon-gamma, to induct then be administered, optionally with interferon-gamma, to induct then be administered, optionally with interferon-gamma, to induct the administered calls involving a signal pathway between the seceptor. It's coding sequence can be used in gene therapy for elated disorders in mammals (especially humans), e.g. tumours, autoimmune and inflammatory diseases or inherited genetic disord introducing into cells, and expressing, therapeutically effective of a vector, e.g. a virus comprising a gene encoding TRELL. It me be of use in the preparation of prepare probes for screening thereof.
                                                                                                                    Tumour necrosis factor related ligand - useful for, e.g. treating auto-immune disease and immune responses to tissue grafts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       11.3%; Score 32; DB 2; Length 225; 100.0%; Pred. WPI; 2000-500381/45. N-PSDB; AAC01271 New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and fo diagnostic, forensic, gene therapy and chromosome mapping procedu

Claim 13; SEQ ID NO 5346; 71pp + Sequence Listing; English.

The present sequence is a polypeptide encoded by one of a large n 5' ESTs derived from mRNAs encoding secreted proteins. The 5' EST prepared from total human RNAs or polyA+ RNAs derived from 30 dif tissues. EST sequences usually correspond mainly to the 3' untran region (UTR) of the mRNA because they are often obtained from old primed cDNA libraries. Such ESTs are not well suited for isolating sequences derived from the 5' ends of mRNAs and even in those cas longer cDNA sequences have been obtained, the full 5' UTR is rare included. 5' ESTs are derived from mRNAs with intact 5' ends and therefore be used to obtain full length cDNAs and genomic DNAs. 5' are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory seand to design expression and secretion vectors

Novel human diagnostic and therapeutic polypeptide useful for id test compound which specifically binds to a polypeptide encoded diagnostic and therapeutic polymucleotide, and to induce antibod.

Claim 27; SEQ ID NO 770; 591pp; English.

The invention relates to novel human diagnostic and therapeutic polymucleotides designated dithp (ACC46080-ACC46749) and to their polymucleotides designated dithp (ACC46080-ACC46749) and to their proteins (DITHP, ABR41136-ABR41812). The invention also relates polymucleotide sequences at least 90% identical to the dithp CDN, sequences of the invention; recombinant vectors, host cells and transpagenic organisms comprising a dithp nucleic acid sequence; the recombinant production of DITHP proteins; antibodies specific for proteins; microarrays comprising dithp nucleic acid sequences; medetecting dithp nucleic acid sequences; medetecting dithp nucleotide and protein sequences; medetecting dithp nucleotide and protein sequences and DITHP proteins may be use probe. Dithp nucleic acid sequences and DITHP proteins may be use the compounds which sportfically bind a DITHP proteins may be use diagnosis of a wide variety of conditions including cancer and of proliferative disorders; autoimmune or inflammatory disorders; be viral, fungal or parasitic infections; hormonal disorders; metabor disorders; and connective tissue disorders. They may also be used disorders; and connective tissue disorders. They may also be use screen for modulators of protein activity or gene expression. DIT or cell type and to induce antibodies. They may also be used or cell type and to induce antibodies. The dithp nucleic acids and additionally be used in analysis of the proteome of or cell type and to induce antibodies. The dithp nucleic acids and additionally be used in analysis of the dictore. mentioned above, as a source of antisense sequences, as a source probes and primers, in genotyping and identification of individual the generation of transgenic animal models of human disease or kn humanised animals, in toxicological testing, and in transcript in The present sequence represents a DITHP protein which has recept activity. Note: The sequence data for this patent did not form positivity.

Sequence 749 AA;

The present invention relates to a method of inhibiting skin inflassociated with a skin disorder selected from psoriasis, atopic dermatities and allergic contact dermatities, which involves adminia composition containing delipidated and deglycolipidated Mycobac vaccae cells or M. vaccae culture filtrate. The skin disorder to treated may also include alopecia areata, and skin cancers such a cell carcinoma, squamous cell carcinoma and melanoma. The composiacts by inhibiting the Th2 immune response. The present sequence protein described in the exemplification of the invention

hypertobia and osceomyelite), uveitis and endophthalmitis.

also involved in infections of bone, joints and the central
em, however it is particularly involved in the inflammatory
clated with acne vulgaris. A method for detecting the
absence of P. acnes in a patient comprises contacting a
a binding agent that binds to the protectins of the invention
ing the amount of bound protein in the sample. The
may be used as antigens in the production of antibodies
P. acnes proteins. These antibodies can be used to
expression and activity of P. acnes polypeptides and
eat P. acnes infections. The antibodies may also be used as
gents for determining P. acnes presence, for example, by
i immunosorbent assay (ELISA). Note: The sequence data for
all ont form part of the printed specification, but was
electronic format directly from WIPO at U39105-AAU68017 represent Propionibacterium acnes immunogenic. The proteins and their associated DNA sequences are used in t, prevention and diagnosis of medical conditions caused by The process and these associated of providing cale disorders include SAPHO syndrome (synovitis, acre, 'pub/published\_pct\_sequences

New Propionibacterium acnes polypeptides and polynucleotides enc polypeptide, useful for diagnosing, preventing or treating acne or for stimulating an immune response specific for a P. acnes pr

N-PSDB; ACF64481

Example 1; SEQ ID NO 13058; 1481pp; English

The invention relates to an isolated polymucleotide (ACF64435-Ac encoding a Propionibacterium acnes protein. The invention also rencoding a Propionibacterium acnes protein. The invention also repolymucleotides (ABM3524-ABM64536) immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprision proteins comprising a polypeptide of the invention; fusion proteins comprising a polypeptide of the invention; fusion proteins comprising a polypeptide and an isolated T cell population comprising T cells to polypeptide and an isolated T cell population comprising T cells via this method; a vaccine composition (comprising P. acnes polypeptides, autibodies, fusion proteins, T cell populations of antigen-presenting cells that express the polypeptide); a method for inhibiting the development of P. acnes antient; and a method for inhibiting the development of P. acnes patient; and a method for inhibiting the development of P. acnes proteins, T cell populations or antigen-presenting cells that expressions of professions of proteins. T cell populations or antigen-presenting cells that collypeptides are useful for diagnosing, preventing or treating a protein. The polymucleotides can also be used as probes or prime nucleic acid hybridisation. The vaccine composition is useful for stimulating an immune response against P. acnes, or for treat and the kit is useful for performing a diagnostic assay. The presentence represents a polymeptide predicted to be encoded by an equence represents a polymely protein of a nimmune response against P. acnes, or for treat and the kit is useful for performing a diagnostic assay. The presentence represents a polymely protein of a nimmune response against P. acnes, or form the printed specification, but was obtained in electronic format the printed specification, but was obtained in electronic format the printed specification, but was obtained in electronic format.

Peptide #10143 encoded by human foetal liver single exon probe. (first entry) Conservative Hanzel DK, 19 61 LGLGLALA 68 WPI; 2001-483447/52 Query Match Best Local Similarity Matches 8; Conserv 12 LGLGLALA Sequence 55 AA; WO200157277-A2 Homo sapiens 04-FEB-2000; 26-MAY-2000; 09-AUG-2001 17-0CT-2001 AAM36451; Penn SG, RESULT 28 AAM36451 à nvention relates to human single exon nucleic acid probes 110066-AA128459). The present sequence is a peptide encoded robe. The SENPS are derived from human Heida cells. The SENPS or produce a single exon microarray, which can be used for an gene expression in a sample derived from human cervical lls. By measuring gene expression, the probes are therefore ling and/or staging of diseases of the cervix, notably ar. Note: The sequence data for this patent did not form rinted specification, but was obtained in electronic format WIPO at ftp.wipo.int/pub/published\_pct\_sequences ö derived single exon nucleic acid probes useful for analyzing on in human cervical epithelial cells. encoded by probe for measuring cervical gene expression. microarray, gene expression, cervical epithelial cell; Gaps ; 2.8%; Score 8; DB 4; Length 55; 100.0%; Pred. ```
The present invention relates to single exon nucleic acid probe measuring human gene expression in a sample derived from human ABA21535-ABA41305). The present sequence is a protein encoded by probe. The probes may be used for predicting, measuring and disigned expression in samples derived from the human heart via micing measuring gene expression, the probes are useful for predicting human heart and vascular system e.g. cardiovascular disease hypertension, cardiac arrhythmias and congenital heart disease. Sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly fine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                probes which are derived from genomic sequences expressed in the bone marrow. They can be used to measure gene expression in bone samples, which may enable the improved diagnosis and treatment o such as lymphoma, leukaemia and myeloma. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; bone marrow expressed exon; gene expression analysis; pro

The invention relates to a single exon nucleic acid probe (SENP) measuring human gene expression in a sample derived from human acliver, comprising one of 13109 defined nucleotide sequences giver specification (or complements/ fragments). The probe hybridises a stringency to a nucleic acid molecule expressed in the human adul (I) may be used for predicting, measuring and displaying gene ext in samples derived from human adult liver. The genes identified means the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the samples of the sam
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia associated with coronary heart disease. ABG47348-ABG5930 repress liver single exon encoded peptides of the invention. Note: The st information for this patent does not appear in the printed specified but was obtained in electronic format directly from WIPO at ftp:wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                          Human; liver; cirrhosis; hyperlipoproteinaemia; hyperlipidaemia; hypercholesterolaemia; coronary heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human genome-derived single exon nucleic acid probes useful for gene expression in human adult liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .

iressable set of single exon nucleic acid probes, used to expression in human lung samples.

ID NO 35300; 634pp; English.

probes for measuring gene expression in a sample derived ing comprising single exon nucleic acid probes having one of a acid sequences mentioned in the specification, or their or the 12387 open reading frames derived from the 12614 included are a microarray comprising the novel set of probes set of probes which hybridise at high stringency to a nucleic at in the human lung; measuring gene expression in a sample human lung, comprising (a) contacting the array with a detectably labeled nucleic acids derived from human lung measuring the label detectably bound to each probe of the fying exons in a eukaryotic genome, comprising (a) in the predicting at least one exon from genomic sequences of it and the first of th ic acids from eukaryote lung mRNA, to a single exon probe, ment identical to the predicted exon, the probe is included mentioned microarray; assigning exons to a single exon probe, i) identical to the predicted exon, the probe is included mentioned microarray; assigning exons to a single gene, i) identifying exons from genomic sequence by the method measuring the expression of each of the exons in several raying a probe with the exon, where a common pattern of the exons in the tissues and/or cell types indicates that uld be assigned to a single gene; a peptide comprising one iences, mentioned in the specification, or encoded by the reading frames (ORF). The probes are used for gene expression if for identifying exons in a gene, particularly using human mRNA, and for the study of lung diseases such as asthma, lung lung diseases such as asthma, lung lisease (COPD), interstitial lung iic obstructive pulmonary disease (COPD), interstitial lung familial idiopathic pulmonary fibrosis, neurofibromatosis, reosis, Gaucher's disease, Niemann-Pick disease, Hermanskyme, sarcoidosis, pulmonary haemosiderosis, pulmonary i, lymphangioleiomyomtosis, pulmonary alveolar proteinosis, drome, fibrocystic pulmonary dysplasia, primary ciliary ulmonary hypertension and hyaline membrane disease. The 1 relates to a spatially-addressable set of single exon

Human genome-derived single exon nucleic acid probes useful for a gene expression in human cervical epithelial cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to human single exon nucleic acid; (SENP: see AA110068-AA128459). The present sequence is a peptide by one such probe. The SENPs are derived from human Hela cells. The be used to produce a single exon microarray, which can be use measuring human gene expression in a sample derived from human cepithelial cells. By measuring gene expression, the probes are the useful in grading and/or staging of diseases of the cervix, notate cervical cancer. Note: The sequence data for this patent did not part of the printed specification, but was obtained in electronic directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
present sequence is a peptide/protein encoded by a single exon the invention. Note: The sequence data for this patent did not for the printed specification, but was obtained in electronic for directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The present invention relates to single exon nucleic acid probes see AA131315-AA157546). The present sequence is a peptide encoded such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples d from human placenta. The probes are useful for antenatal diagnosi human genetic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                               Human genome-derived single exon nucleic acid probes useful for a gene expression in human placenta.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Protein #8889 encoded by probe for measuring heart cell gene expr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; gene expression; heart; microarray; vascular system; cardiovascular disease; hypertension; cardiac arrhythmia;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           relates to a single exon nucleic acid probe for measuring pression in a sample derived from human foetal liver. The cleic acid probes may be used for predicting, measuring and expression in samples derived from human fetal liver. The ce is a peptide encoded by a single exon nucleic acid probe on. Note: The sequence data for this patent did not form inted specification, but was obtained in electronic format WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             lerived single exon nucleic acid probes useful for analyzing on in human fetal liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ) encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                         liver; gene expression; single exon nucleic acid probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                        encoded by human foetal liver single exon probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .;

The present sequence is a protein encoded by one such cobes may be used for predicting, measuring and displaying on in samples derived from the human heart via microarrays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  gene expression, the probes are useful for predicting, jrading, staging, monitoring and prognosing diseases of the and vascular system e.g. cardiovascular disease, cardiac arrhythmias and congenital hear disease. Note: The 1 for this parent did not form part of the printed in electronic format directly from WIPO int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                         nucleic acid probes for analyzing gene expression in human

```
probes which are derived from genomic sequences expressed in the bone marrow. They can be used to measure gene expression in bone samples, which may enable the improved diagnosis and treatment o such as lymphoma, leukaemia and myeloma. The present sequence is protein encoded by one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        probes which are derived from genomic sequences expressed in the brain. They can be used to measure gene expression in brain cell which may enable the diagnosis and improved treatment of nervous diseases such as Alzheimer's disease, multiple sclerosis, schizog epilepsy and cancers. The present sequence is a protein encoded the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human brain expressed single exon probe encoded protein SEQ ID N
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; brain expressed exon; gene expression analysis; probe; mir Alzheimer's disease; multiple sclerosis; schizophrenia; epilepsy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Single exon nucleic acid probes for analyzing gene expression in brains.
                                                Human genome-derived single exon nucleic acid probes useful for
                                                                                                                            present invention provides a number of single exon nucleic

Spatially-addressable set of single exon nucleic acid probes, usec measure gene expression in human lung samples. Spatially-addressable set

Claim 27; SEQ ID NO 36402; 634pp; English.

The invention relates to a spatially-addressable set of single exc nucleic acid probes for measuring gene expression in a sample deriform human lung comprising single exon nucleic acid probes having 12614 nucleic acid sequences mentioned in the specification, or the complements or the 1287 open reading frames derived from the 1261 complements or the 1287 open reading frames derived from the 1261 complements or the 1287 open reading frames derived from the 1261 complements or the 1287 open reading frames derived from the 1261 contact from human lung; measuring gene expression in a caid expressed in the human lung; measuring gene expression in a caid extred from human lung; comprising (a) contaction to detectably labeled nucleic acids derived from human man, in the label detectably bound to each probe of array; identifying exons in a eukaryotic genome, comprising (a) algorithmically predicting at least one exon from genomic sequence the eukaryote; and (b) detecting specific hybridisation of detectably labeled nucleic acids from eukaryote lung mRNA, to a single exon in the above mentioned microarray; assigning exons to a single exon comprising (a) in the above and (b) measuring the expression of each of the exons in several common pattern of microarrays having a probe with the exon, where a common pattern o

**♣** 

the exons in the tissues and/or cell types indicates that build be assigned to a single gene, a peptide comprising one bences, mentioned in the specification, or encoded by the reading frames (ORP). The probes are used for gene expression if for identifying exons in a gene, particularly using human mRNA and for the study of lung diseases such as asthma. Ung it cobstructive pulmonary disease (COPD), interstitial lung it, familial idiopathic pulmonary fibrosis, neurofibromatosis, rosis, Gaucher's disease, Nlemann-Pick disease, Hermanskyme, sarcoidosis, pulmonary haemosiderosis, pulmonary si lymphangioleiomyomicosis, pulmonary alveolar proteinosis, ulmonary hypertension and hyaline membrane disease. The more is a peptide/protein encoded by a single exon probe of n. Note: The sequence date for this patent did not form part si specification, but was obtained in electronic format new NEPO at fib. wipo.int/pub/published\_pot\_sequences

ium acnes polypeptides and nucleic acids useful for ainst and diagnosing infections, especially useful for vulgaris.

ID NO 22477; 1069pp; English.

9105-AAU68017 represent Propionibacterium acnes immunogenic The proteins and their associated DNA sequences are used in prevention and diagnosis of medical conditions caused by disorders include SAPHO syndrome (synovitis, acne, pertosis and osteomyelitis), uveitis and endophthalmitis. so involved in infections of bone, joints and the central, however it is particularly involved in the inflammatory

lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting sample with a binding agent that binds to the proteins of the invand determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antiboc specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used to diagnostic agents for determining P. acnes presence, for example, this patent did not form part of the printed specification, but we obtained in electronic format directly from WIPO at O .. 0; Indels Length 84; 2.8%; Score 8; DB 4; 100.0%; Pred. New Propionibacterium acnes polypeptides and polynucleotides encoc polypeptide, useful for diagnosing, preventing or treating acne vuor for stimulating an immune response specific for a P acnes prot

Example 1; SEQ ID NO 22477; 1481pp; English.

The invention relates to an isolated polynucleotide (ACF64435-ACF6 encoding a Propionibacterium acnes protein. The invention also relaply peptides encoded by the polynucleotides (ABM35624-ABM64536) an immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprise polynucleotide of the invention; antibodies against polypeptides convention; fusion proteins comprising a polypeptide of the invention method for stimulating an immune response specific for a P. acnes polypeptide and an isolated T cell population comprising T cells by via this method; a vaccine composition (comprising P. acnes polype

les, antibodies, fusion proteins, T cell populations, or anting cells that express the polypeptide); a method and kit a or determining the presence or absence of P. acres in a a method for inhibiting the development of P. acres in a P. acres polypeptides, polymucleotides, antibodies, fusion cell populations or antigen-presenting cells that express the are useful for diagnosing, preventing or treating acre for stimulating an immune response specific for a P. acres polymucleotides can also be used as probes or primers for hybridisation. The vaccine composition is useful for the of an immune response against P. acres, or for treating acre is useful for preforming a diagnostic assay. The present resents a polypeptide predicted to be encoded by an ORF (open so contained within the P. acres polymucleotides of the other sequence data for this patent did not form part of specification, but was obtained in electronic format directly ftp.wipo.int/pub/published\_pct\_sequences

Isolated nucleic acid molecules encoding novel ovarian polypeptic useful in the prevention, treatment and diagnosis of cancer (e.g cancer), immune disorders, cardiovascular disorders and neurolog: diseases

Claim 11; SEQ ID NO 2806; 2922pp; English.

The invention relates to 2175 novel human ovarian antigens (ABP4. ABP4328) and to CDNAs encoding them (ABD54131-ABQ56305), and all encompasses polypeptides 90% identical and polynucleotides 95% is to the sequences of the invention. The invention additionally recrecombinant vectors and host cells comprising human ovarian antigens. To polynucleotides, antibodies against human ovarian antigens, and of ovarian antigen polynucleotides and polypeptides in diagnosing treating, prognosing or preventing varian soncer and breast can disorders. Such conditions include ovarian cancer and breast can metastatic tumours of ovarian or breast origin, reproductive syst disorders (e.g., infertility, disorders origin, reproductive syst disorders, infections (e.g., champwida, HIV, toxoplasmosis, and shock syndrome, ovarian cancer and dynamoral, encompanies, infections (e.g., champwida, HIV, toxoplasmosis, and shock syndrome), inflammatory conditions (e.g., mastitis, ophor: vaginitis), immune disorders (e.g., anaemia), cardiovascular disorder respiratory disorders neurological disorders, gastrointestinal cand urinary system disorders, ovarian antigen polypeptides and polymucleotides may also be used in screening for compounds which further he used for gene a carrivity. The polymucleotific than the nead to a carrivity. The polymucleotic further be used for gene therapy, chromosome mapping, in the identification of individuals and in forensic analysis, and the polypeptides may be used as food additives or to prepare antibodi useful in disease diagnosis, drug targeting and phenotyping. The sequence represents a human ovarian antigen of the invention. N sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly f at ftp.wipo.int/pub/published\_pct\_sequences

Claim 20; SEQ ID NO 31545; 103pp; English.

The invention relates to isolated polymucleotide (I) and polypept sequences. (I) is useful as hybridisation probes, polymerase chair reaction (PCR) primers, oligomers, and for chromosome and gene ma and in recombinant production of (II). The polymucleotides are all in diagnostics as expressed sequence tags for identifying express; genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) useful for generating antibodies against it, detecting or quantit polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical in a supplement. (II) and (II) are useful for treating di involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in polypeptide and polymucleotide sequences have applications in responsible for genetic disorders or other traits to assess biodical and to produce other types of data and products dependent on DNA amino acid sequences. Claim 20; SEQ ID NO 48474; 103pp; English.

The invention relates to isolated polymuclectide (I) and polypept sequences. (I) is useful as hybridisation probes, polymerase chair reaction (PCR) primers, oligomers, and for chromosome and gene ma and in recombinant production of (II). The polymuclectides are all in diagnostics as expressed sequence tags for identifying express genes. (I) is useful in gene therapy techniques to restore normal extivity of (II) or to treat disease states involving (II). (II) useful for generating antibodies against it, detecting or quantity useful for generating antibodies against it, detecting or quantity useful for generating antibodies against it, detecting or quantity useful for generating antibodies against it, detecting or quantity of supplement. (II) and its binding partners are useful in medical of supplement. (II) and its binding partners are useful in medical in nyphypeptide and polymuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodicand to produce other types of date and products dependent on DNA amino acid sequences. nucleic acids, useful for identifying proteins or screening is nucleic acids required for cellular proliferation to idate molecules for rational drug discovery programs.

ID NO 64461; 1766pp; English.

sense sequences given in the specification where expression c acid inhibits proliferation of a cell. Also included are comprising a promoter operably linked to the nucleic acid lypeptide whose expression is inhibited by the antisense (2) a host cell containing the vector; (3) an isolated of it is inhibited by the antisense (5) a host cell containing the vector; (3) an isolated of its inhibited by the antibody capable of specifically binding de,(5) producing the polypeptide; (6) inhibiting cellular or the activity of a gene in an operon required for it or the activity of a gene in an operon required for it or that has an activity against a biological pathway proliferation, or that inhibits cellular proliferation; (8) igene required for cellular proliferation of the proliferation-required gene or its gene product lies which the test compound that inhibits proliferation of an itivity; (11) a culture comprising strains in which the gene exexpressed or underexpressed; (12) determining the extent of the strains is present in a culture or collection of 13) identifying the target of a compound that inhibits the carea proliferation of the strains is present in a culture or collection of 13) identifying the target of a compound that inhibits the careant of an organism. The antisense nucleic acids are useful for proliferation of the careant or for manisher modeling and proliferational confideration of the careant or collections or screening for homologous nucleic acids required proliferation of the careant or confideration of the careant or collection of the careant Y programs, or for screening homologous nucleic acids proliferation in cells other than S. aureus, S. typhimurium, or P. aeruginosa. The present sequence is encoded by one of okaryotic essential genes. Note: The sequence data for this form part of the printed specification, but was obtained pub/published\_pct\_sequences. 1 relates to an isolated nucleic acid comprising any one of

The invention relates to isolated polynucleotide (I) and polypept sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCN) primers, oligomers, and for chromosome and gene me and in recombinant production of (II). The polynucleotides are a in diagnostics as expressed sequence tags for identifying expressing the state of the polymerase of a critical and seaful in gene therapy techniques to restore normal cutivity of (II) or to treat disease states involving (II). (II) useful for generating antibodies against it, detecting or quantity of sequence in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical: of sites expressing (II). (I) and (II) are useful for treating dinvolving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutation responsible for genetic disorders or other traits to assess biod: and to produce other types of data and products dependent on DNA amino acid sequences. Agalon10-ABG30377 represent novel human disamino acid sequences of the invention. ```
This invention, in the area of plant biotechnology, relates to not polymerical comprising a nucleotide sequence encoding a prote is involved in or associated with the synthesis, metabolism or degradation of carbohydrates in the plant grain and the expressic which is up-regulated during grain filling. The plant is selected corn, towato, banana, canola, cotton, peanue, sorghum, tobacco, sugarbeet, wheat, and rice. The invention may be useful for the improvement of protein, oil, starch, fibre and moisture content cereal grains. In addition, carbohydrate levels may be modified to desirable level using the present invention. The present sequence of a rice protein of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the fib. wipo.int/pub/publishedpot_sequences.
                                                                       New plant genes encoding polypeptides having an activity involved associated with the synthesis, metabolism or degradation of carbotin the plant grain useful in generating plants having improved nutritional properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Obtaining plants having enhanced growth and/or fruit yield and/or flowering rate, specifically C3 plants grown under limiting condit useful in plant molecular biology and commercial plant breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method of obtaining plants with

wth and/or commercial yield under growth limiting conditions. omprises obtaining a population of plants transformed to lypeptide having at least 60% sequence identity to any of 8 d sequences, growing the plants and selecting plants he polypeptide. The methods and compositions of the present e useful in commercial plant breeding, particularly for lants having enhanced growth and/or fruit yield and/or te. The present sequence represents Synechococcus sp.
                                                                                                                                                                                                                                                                                                                                                                                                          otein.

nucleic acid detection reagent for detecting 1000 or more cosophila and for elucidating cell signaling and cell-cell

EQ ID NO 516; 21pp + Sequence Listing; English.

irelates to an isolated nucleic acid detection reagent stecting 1000 or more genes from Drosophila. The invention is reloopmental biology and in elucidating cell signalling and eractions in higher eukaryotes for the development of therapeutics and pharmaceutical drugs. The invention nomic DNA sequences (ABL16176-ABL30511), expressed DNA 1001840-ABL16175) and the encoded proteins (ABB57737-ie sequence data for this patent did not form part of the fication, but was obtained in electronic format directly ftp.wipo.int/pub/published\_pct\_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to novel human secretory or membra proteins (ADA54072-ADA55710) and their coding sequences (ADA5243. ADA54071). The coding sequences are useful in the gene therapy o diseases caused by abnormalities of the proteins, e.g. cancer, inflammatory diseases, osteoporosis or neurological disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New polynucleotides encoding full-length polypeptides, e.g. secr and/or membrane proteins, useful for developing medicines for diwhich the gene is involved, or as target molecules for gene ther.

Costigan M; Befort K, D'urso D, Woolf C,

WPI; 2003-268312/26. GENBANK; P36269. New composition comprising two or more isolated polypeptides, use preparing a medicament for treating pain in an animal.

Claim 1; Page; 1017pp; English.

The invention discloses a composition comprising two or more isolor human polynucleotides or a polynucleotide which represents a far derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain kit to perform the method, an array, a method for identifying an that increases or decreases the expression of the polynucleotide subjected to pain, a method for identifying a compound which regulate expression of a polynucleotide sequence which is differentially expressed in neuronal tissue of a first argument of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound or small composit method for identifying a compound or small composit method for identifying a compound or small molecule that regulate compound to a polymucleotide or more of the polypeptides or their antibodies. The polymucleotide or the compound a pharmaceutical composition comprising the one or more pain and a pharmaceutical composition comprising the one or more modulates its activity is useful for preparing a medicament for pain (e.g. spinal segmental nerve injury (SNI)) in an animal (e.g. gether any complex of the specification) which is differentially expressed during pain. The sequence data for this patent did not form part of the prince from in the prince of the pri ftp.wipo.int/pub/published\_pct\_sequences.

ion comprising two or more isolated polypeptides, useful for medicament for treating pain in an animal.

=; 1017pp; English.

n discloses a composition comprising two or more isolated rat functionides or a polynucleotide which represents a fragment, rallelic variation of the nucleic acid sequence. Also a vector comprising the nucleic acid sequence. Also ellawer the method for identifying a nucleotide sequence ferentially regulated in an animal subjected to pain and arm the method, an array, a method for identifying a nucleotide sequence sentially expressed in neuronal tissue of a first animal search and for identifying a compound which regulates on of a polynucleotide sequence which is differentially an animal subjected to pain, a method for identifying a compound which regulates the arm animal subjected to pain, a method for identifying a compound of a polynucleotide sequence which is differentially an animal of one or more of the left, a method for producing a pharmaceutical composition, a lentifying a compound useful in treating armaceutical composition comprising the one or more or their antibodies. The polynucleotide or the compound that is activity is useful for preparing, chronic constriction and spared nerve injury (SNI)) in an animal (e.g. gene should be a presented is a human protein (shown in Table 2 of ithion) which is differentially expressed during pain. Note: data for this patent did not form part of the printed 'bub/bublished oct sequence formed and experience of the printed bub/bublished oct sequence formed and sparent did not form part of the printed 'bub/bublished oct sequence formed and parameters of the printed bub/bublished oct sequence formed and sparent did not form part of the printed 'bub/bublished oct sequence formed and sparent did not form part of the printed 'bub/bublished oct sequence formed and segmented in electronic form directly from Note: pub/published\_pct\_sequences.

New human protein modification and maintenance molecules and polynucleotides, useful for diagnosing, treating or preventing aut or inflammatory disorders (e.g. AIDS, allergy or anemia), multiple sclerosis or cancer.

Claim 1; SEQ ID NO 44; 405pp; English.

This invention relates to novel isolated human proteins, which are protein modification and maintenance molecules (PWMM). The cellula processes regulating modification and maintenance of protein molec coordinate their function, conformation, stabilisation and degrada Each of these processes is mediated by key enzymes or proteins suc kinases, phosphatases, proteases, protease inhibitors, isomerases, transferases and molecular chapterones. Compounds which modulate the proteins of the invention may have anti-HIV, antiallargic, antionial antidiabeti antioniflammatory, antianaemic, antiatrhisonian, nootropic, antiparatic, antiatrhisonian, notropic, antiparasic, antipartorpic, dermatological, antidiabeti nephrotropic, antiparasic, antihelminic, antipacriatic, uropat ophthalmological, antiphrasic, happacotropic, dermatological, anticitation and maintenance molecules (PMMMS), the DNA septoteins of the invention may be useful for gene therapy. The huma protein modification and maintenance molecules (PMMMS), the DNA septotession of PMMM, particularly cell proliferative disorders associated with aberr expression of PMMM, particularly cell proliferative disorders (for

New antisense nucleic acids, useful for identifying proteins or s for homologous nucleic acids required for cellular proliferation isolate candidate molecules for rational drug discovery programs.

Claim 25; SEQ ID NO 44629; 1766pp; English.

The invention relates to an isolated nucleic acid comprising any composition where exproceed the 6213 antisense sequences given in the specification where exproceed the 6213 antisense sequences given in the specification where expression of the nucleic acid (12) a vector comprising a promoter operably linked to the nucleic modelic acid, (2) a host cell containing the vector; (3) an isolate polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically bit polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically bit proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity encounted for proliferation, or that inhibits cellular proliferation identifying a gene required for cellular proliferation or the biol pathway in which a proliferation required gene or its gene product or a gene not which the test compound that inhibits proliferation or a gene on which the test compound that inhibits proliferation or a gene on which the test compound that inhibits proliferation or a gene on which the test compound that inhibits proliferation or a gene on which the test compound that inhibits proliferation or a gene on which the test compound that inhibits proliferation or a gene on which the test compound that inhibits proliferation or a gene or which the pass of the product or a gene or which the test compound that inhibits proliferation or a gene or which the test compound that the control or pathway in which the test compound that inhibits proliferation or proved the control or pathway in which the test compound that inhibits proliferation or proved the control or pathway in which the test compound that inhibits proliferation or the product or a gene or which the test compound that inhibits proliferation or the product or a gene or which the pass or the product or a gene or which the pass or the product or the organism acts; (1) a culture comprising strains in which the product is overexpressed or underexpressed; (12) determining the to which each of the strains is present in a culture or collection strains; or (13) identifying the target of a compound that inhibit prolliferation of an organism. The antisense nucleic acids are usef identifying proteins or screening for homologous nucleic acids required.

```
ry programs, or for screening homologous nucleic acids proliferation in cells other than S. aureus, S. typhimurium, e or P. aeruginosa. The present sequence is encoded by rokaryotic essential genes. Note: The sequence data for this of form part of the printed specification, but was obtained /pub/published_pct_sequences

octer baumanii proteins and nucleic acids, useful as reagents 1g a bacterial disease, as components of antibacterial targets for antibacterial drugs, or as biocontrol agents for

ID NO 5138; 328pp; English.

I relates to isolated Acinetobacter baumannii nucleic acids.

Ini nucleic acids and polypeptides are useful as reagents of abacterial disease, as components of antibacterial targets for antibacterial drugs, to detect the presence of and other Acinetobacter species in a sample, in screening the ability to interfere with the A. baumannii life cycle A. baumannii life cycle A. baumannii life cycle as biocontrol agents for present sequence represents the amino acid sequence of an A. tein.
